

Case Study 1: “IndiTech” and the Smart Learning Tablet

IndiTech was based out of **Bengaluru** and had grown rapidly over the past decade from a small educational software startup into a well-known EdTech hardware innovator. Its founder, Raghav Menon, had started by designing low-cost educational apps for rural schools. Over time, IndiTech built a reputation for affordable, robust educational technology products.

Recently, IndiTech developed a new product called **ShikshaTab**—a smart learning tablet preloaded with interactive textbooks, multilingual voice support, offline content access, live class capability, and AI-based performance tracking for students. The device was durable, had long battery life, and worked effectively even with low internet connectivity—ideal for semi-urban and rural India.

While management believed ShikshaTab could revolutionize learning accessibility, they faced uncertainty. They were unsure whether to target government schools, private urban schools, or individual households. The marketing strategy, pricing, and supply chain decisions were deeply interlinked. If priced low for mass rural adoption, margins would shrink. If priced high for private schools, volumes would fall.

IndiTech was considering an exclusive distribution partnership with **Tata Teleservices**, which had an established rural distribution network. However, this exclusivity meant dependency and limited control over retail pricing.

IndiTech knew that product success depended on correct market positioning, effective distribution, and a flexible supply chain capable of serving diverse regions.

CASE QUESTIONS

1. Identify at least two different possible target markets for ShikshaTab. How would the marketing strategy differ for each target market? How would the pricing strategy change and the volume sold? Identify the supply chain implications for each target market.
2. If IndiTech decided to go after multiple market segments, identify the supply chain requirements. Should they have multiple supply chains?
3. Discuss the advantages and disadvantages of going with one exclusive distributor. How would this decision be affected by the selection of target market? What would be the implications on the supply chain? What would you do if you were IndiTech?

Case Study 2: “AgroNova” and the Smart Irrigation Sensor

AgroNova operated from **Pune** and was founded by agricultural engineers passionate about improving farm productivity. Starting with soil testing kits, the company grew into a leader in precision farming tools.

Their latest innovation, **JalRakshak**, was a solar-powered smart irrigation sensor that monitored soil moisture, weather conditions, and crop water requirements in real time, sending data to farmers via a mobile app in regional languages.

The product could significantly reduce water wastage and increase crop yield. However, AgroNova was unsure whether to market JalRakshak to small marginal farmers, large agribusiness farms, or through government subsidy programs.

Pricing was a challenge: small farmers needed affordability, but large farms could pay premium prices. AgroNova considered partnering exclusively with **Indian Farmers Fertiliser Cooperative Limited (IFFCO)** for distribution across rural India.

While this would provide massive reach, AgroNova worried about losing flexibility and brand identity.

CASE QUESTIONS

1. Identify at least two different possible target markets for JalRakshak. How would the marketing strategy differ for each target market? How would the pricing strategy change and the volume sold? Identify the supply chain implications for each target market.
2. If AgroNova decided to go after multiple market segments, identify the supply chain requirements. Should they have multiple supply chains?
3. Discuss the advantages and disadvantages of going with one exclusive distributor. How would this decision be affected by the selection of target market? What would be the implications on the supply chain? What would you do if you were AgroNova?

Case Study 3: “MediWave” and the Portable Diagnostic Kit

MediWave, headquartered in **Hyderabad**, began as a biomedical startup developing low-cost diagnostic tools. Their breakthrough product, **SwasthyaScan**, was a portable diagnostic kit capable of conducting blood tests, ECG, oxygen level monitoring, and glucose testing in remote areas.

The device could transform rural healthcare delivery, especially in villages with limited hospital access. However, MediWave struggled with identifying the right target: government primary health centers, private clinics, NGOs, or direct-to-consumer sales.

They were considering exclusive distribution through **Apollo Hospitals’** outreach network for credibility and reach.

This decision would influence pricing, volumes, and the ability of their supply chain to manage maintenance and after-sales service across India.

CASE QUESTIONS

1. Identify at least two different possible target markets for SwasthyaScan. How would the marketing strategy differ for each target market? How would the pricing strategy change and the volume sold? Identify the supply chain implications for each target market.
2. If MediWave decided to go after multiple market segments, identify the supply chain requirements. Should they have multiple supply chains?

3. Discuss the advantages and disadvantages of going with one exclusive distributor. How would this decision be affected by the selection of target market? What would be the implications on the supply chain? What would you do if you were MediWave?

Case Study 4: “EcoRide” and the Electric Scooter

EcoRide was a fast-growing EV startup from **Chennai**. Founded by automobile engineers, the company had developed **VoltGo**, a lightweight electric scooter with swappable batteries, GPS tracking, and a mobile app for ride diagnostics.

EcoRide believed VoltGo could disrupt urban commuting. However, they were uncertain whether to target college students, working professionals, or gig delivery workers.

They were negotiating exclusive sales and servicing rights with **Flipkart** to leverage its logistics network.

This raised concerns about dependency, delivery timelines, servicing infrastructure, and battery replacement logistics.

CASE QUESTIONS

1. Identify at least two different possible target markets for VoltGo. How would the marketing strategy differ for each target market? How would the pricing strategy change and the volume sold? Identify the supply chain implications for each target market.
2. If EcoRide decided to go after multiple market segments, identify the supply chain requirements. Should they have multiple supply chains?
3. Discuss the advantages and disadvantages of going with one exclusive distributor. How would this decision be affected by the selection of target market? What would be the implications on the supply chain? What would you do if you were EcoRide?

Case Study 5: “FreshKart” and the Farm-to-Home Cold Chain Box

FreshKart operated from **Ahmedabad** and specialized in reducing food wastage. Their innovation, **CoolCrate**, was a solar-powered cold storage and transport box designed for transporting fruits and vegetables from farms to cities without spoilage.

FreshKart believed CoolCrate could transform India’s agricultural supply chain. But they were unsure whether to sell to farmer cooperatives, wholesale mandi traders, or large retail chains.

They were considering exclusive distribution via **Reliance Retail** for rapid scale.

The decision would affect pricing, volume, transportation logistics, and maintenance of the cooling units.

CASE QUESTIONS

1. Identify at least two different possible target markets for CoolCrate. How would the marketing strategy differ for each target market? How would the pricing strategy

change and the volume sold? Identify the supply chain implications for each target market.

2. If FreshKart decided to go after multiple market segments, identify the supply chain requirements. Should they have multiple supply chains?
3. Discuss the advantages and disadvantages of going with one exclusive distributor. How would this decision be affected by the selection of target market? What would be the implications on the supply chain? What would you do if you were FreshKart?
